

CONCLUSION :

- **Single, live, foetus in cephalic presentation in present scan.**
- **Gestational age : Around 28 weeks , 2 days.**
- **Single loose loop of cord around foetal neck.**

(This scan is not done for evaluation for anomalies. It is meant for evaluation of foetal growth parameters, weight and well being. Foetal anomaly scan, expected to be done at 19 to 20 weeks, has not been done/ documented. Hence all anomalies which can be masked by foetal position and foetal size and amount of liquor at present age of gestation cannot be evaluated)
